Notations

$\mathbb{Z} = \{... - 3, -2, -1, 0, 1, 2, 3...\}$
$\mathbb{Z}^{+} = \{1, 2, 3...\}$
$\mathbb{Z}^{-} = \{... - 3, -2, -1\}$
$\mathbb{Z}^{0+} = \{0, 1, 2, 3...\}$
$\mathbb{Z}^{0-} = \{... - 2, -1, 0\}$

1 Introduction: Divisibility, Prime, GCD

Let $a, b \in \mathbb{Z}$ and $a > 0$ we say a divides b, $a|b$ if $b = ac$ for some $c \in \mathbb{Z}$. Here, a is the divisor or factor of b and b is the multiple of a.

Note:

- Sign has no effects: $6|12, -5|53, 9| - 81$
- Divisibility is a statement not an operator like divide /
- Divisibility is mostly deals with Positive Integers.

Properties of Divisibility
Let $a, b, c \in \mathbb{Z}$, then

- If $a|b$ and $a|c$ then $a|b + c$
- If $a|b$ and $b|c$ then $a|c$
- If $a|b$ then $a|mb$ for some integer m
- If $a|b$ and $a|c$ then $a|bm + cn$ for some integer m, n

Definition 1 (Prime)**.** *Let $p > 0$ and $p \in \mathbb{Z}^{+}$, p is prime iff the divisor of p is 1 and p.*

Definition 2 (Composite)**.** *Let $M > 1$ which is not prime is composite.*

Remark 1. *0 and 1 are neither prime nor composite.*

Theorem 1 (Fundamental Theorem of Arithmetic)**.** *Any integer greater than 1 can be written as a unique product of primes. Here, the primes ordering does not matter.*

Definition 3 (Common Divisor)**.** *The integer c is the common divisor of a and b if $a = cn$ and $b = cm$ for some integer n, m or if $c|a$ and $c|b$.*

Definition 4 (GCD)**.** *gcd(a,b) is the largest common divisor of a and b, $gcd(a, b) > 1$ and by convention $a, b \neq 0$.*

Definition 5 (Co-primes)**.** *If $gcd(a, b) = 1$ then a, b are relatively prime or coprime though a, b needs not be prime.*

Lemma 1 (Bézout's Identity)**.** *If $gcd(a, b) = d$ then $\exists x, y \in \mathbb{Z}$ s.t $ax + by = d$*

Lemma 2. *if $a = bq + r$ then $gcd(a, b) = gcd(b, r)$*

Lemma 3. *if $a|c$ and $b|c$ and $gcd(a, b) = 1$ then $ab|c$*

Theorem 2 (Division)**.** *Let $a, b \in \mathbb{Z}$, $b > 0$ then $\exists q, r \in \mathbb{Z}$ s.t $a = bq+r$ where, $0 \leq r < b$*

Definition 6 (Linear Diophantine Eqn)**.** *Given $a, b, c \in \mathbb{N}$ the eqn. $ax + by = c$ has a solution for $x, y \in \mathbb{Z}$ iff $gcd(a, b)|c$*

Note: To solve Diophantine we can used Extended Euclid's Algorithm.

2 Congruences

Definition 7. *Let n be fixed positive integer, $a, b \in Z$ are said to be congruent modulo n, $a \equiv b \pmod{n}$ if $n|(a - b)$ i.e, $a - b = nk$ for some $k \in \mathbb{Z}$.*

Example 1. $n = 7$, $3 \equiv 24 \pmod{7} \implies 7|(3 - 24) \implies 7| - 21$

Example 2. $6 \not\equiv 1 \pmod{3} \implies 3 \not|(6 - 1)$

Note

- Any two integers are congruent modulo 1, $a \equiv b \pmod{1} \impliedby 1|(a - b)$
- Two integers are congruent modulo 2 if either both even or both odd.

Definition 8 (Equivalence Class)**.** *For $x \in \mathbb{Z}$ define the equivalence class of x w.r.t $\equiv \pmod{n}$ by $[x] = \{a \in \mathbb{Z} | a \equiv x \pmod{n}\}$*

Fact: There are exactly n equivalence classes modulo n i.e, $[0], [2], \ldots [n - 1]$ that is, every integer is in one of those classes.

Lemma 4. *If $n > 1$ and a be any integers and r be remainder when a/n then $a \equiv r \pmod{n}$ or $\forall a \in \mathbb{Z}$ a is congruent to exactly one of those least residue modulo n.*

Proof. $a/n \implies a = qn + r$ where, $q, r \in \mathbb{Z}$ and $0 \leq r < n$
$a - r = qn \implies a \equiv r \pmod{n}$ □

Corollary 1. *If $a \equiv r \pmod{n}$ then $r = \{0, 1, 2, \ldots n - 1\}$*

Definition 9 (Complete System of Residue (CSR))**.** *Given $a \in \mathbb{Z}$ let q and r be its quotient and remainder upon division by n i.e, $a = qn + r, 0 \geq r < n$. Then by definition of congruences $a \equiv r \pmod{n}$ and $r = \{0, 1, 2, \ldots n - 1\}$ called the least non negative residue(remainder) modulo n.*
*In general a collection of $\{a_1, a_2, \ldots, a_n\}$ is a **Complete System of Residue** modulo n if each $a_i \equiv r_i \pmod{n}$ i.e, $\{a_1, a_2, \ldots, a_n\} \equiv \{0, 1, 2 \ldots n - 1\} \pmod{n}$ and $a_i \not\equiv a_j \pmod{n}$*

Example 3. *Consider $n = 4$ and $S = \{12, 11, 8, 3\}$ does S form CSR modulo 4.*

Soln. $r = \{0, 1, 2, 3\}$ and $12 \equiv 0 \pmod{4}$ and $8 \equiv 0 \pmod{4}$ implies, $12 \equiv 8 \pmod{4}$. So, S does not form CSR. □

Theorem 3. *For arbitrary integers a and b, $a \equiv n \pmod{n}$ iff a and b leaves the same non-negative remainder when divided by n.*

Proof. $a \equiv b \pmod{n} \implies a - b = nk \implies a = b + nk$ for some $k \in \mathbb{Z}$
$n|b \implies b = nq + r \implies a = nq + r + nk \implies a = (nq + nk) + r$
Now, assume $a = nq_1 + r$ and $b = nq_2 + r$ then $a - b = nq_1 + r - nq_2 - r \implies a - b = n(q_1 - q_2) \implies a \equiv b \pmod{n}$ □

Theorem 4. *Let $n > 1$ and $a, b, c, d \in \mathbb{Z}$ then the following properties hold :*

1. $a \equiv a \pmod{n}$
2. *if* $a \equiv b \pmod{n}$ *then* $b \equiv a \pmod{n}$
3. *if* $a \equiv b \pmod{n}$ *and* $b \equiv c \pmod{n}$ *then* $a \equiv c \pmod{n}$
4. *if* $a \equiv b \pmod{n}$ *and* $c \equiv d \pmod{n}$ *then* $a + c \equiv b + d \pmod{n}$ *and* $ac \equiv bd \pmod{n}$
5. *if* $a \equiv b \pmod{n}$ *then* $a + c \equiv b + c \pmod{n}$ *and* $ac \equiv bc \pmod{n}$
6. *if* $a \equiv b \pmod{n}$ *then* $a^k \equiv b^k \pmod{n}$ *for any* $k \in \mathbb{Z}^+$

Proof. $(Prop5)$ Using prop1 and prop4 $a \equiv b \pmod{n}$ and $c \equiv c \pmod{n}$ implies, $a+c \equiv b + c \pmod{n}$ and $ac \equiv bc \pmod{n}$
$(prop6)$ Using prop4 we can established the prove. □

Divisibility Test for an Integer

- An integer is divisible by 2 iff it's unit digits is $0, 2, 4, 6, 8$
- For by 3 its digits sum should be divisible by 3
- For 4, the no. form by its last digits should be divisible by 4
- For 5, last digit should be 0 or 5.
- An integer N is divisible by 6 iff $6|M$, where $M = a_0 + 4a_1 + \cdots + 4a_m$
- For 8, the no. formed by last three digits should be divisible by 8.
- For by 9 its digits sum should be divisible by 9
- For 10, the last digit should be 0
- For 11, $11|N$ iff the altering sum of its digit is divisible by 11. E.g, $N = 639162513 \implies 3 - 1 + 5 - 2 + 6 - 1 + 9 - 3 + 6 = 22$

3 Linear Congruences

Definition 10. *An eqn, of the form $ax \equiv b \pmod{n}$ is called the Linear congruences.*

Lemma 5. *$ax \equiv b \pmod{n}$ has a solution iff $d|b$, where $d = gcd(a, n)$. If $d|b$ then it has d mutually incongruent solution modulo n.*

Note:

1. if x_1 is a soln of $ax \equiv b \pmod{n}$ then any other $x_2 \equiv x_1 \pmod{n}$ is congruent solution.
2. if x_1 and x_2 are both soln and $x_1 \not\equiv x_2 \pmod{n}$ then it is called incongruent soln of $ax \equiv b \pmod{n}$.

Definition 11 (Inverse of Modulo n). *Any value of x which is a solution of $ax \equiv 1 \pmod{n}$ is called the inverse of modulo n. Thus if a^{-1} is the inverse then $aa^{-1} \equiv 1 \pmod{n}$*

Strategy for solving: $ax \equiv b \pmod{n}$

1. a is invertible modulo n iff $gcd(a,n) = 1$, $ax + ny = 1$ so, $ax \equiv 1 \pmod{n}$
2. Reduction: if $ca \equiv cb \pmod{n} \implies a \equiv b \pmod{\frac{n}{gcd(c,n)}}$
3. $ax \equiv b \pmod{n}$ has a soln iff $gcd(a,n)|b$
4. if $ax \equiv b \pmod{n}$ has a soln then there are $gcd(a,n)$ number of soln separated by $\frac{n}{gcd(a,n)}$

4 Fermat's Little Theorem

Theorem 5. *Let p be prime and $gcd(a,p) = 1$ then $a^{p-1} \equiv 1 \pmod{p}$*

Proof. Assume p is prime and $p \not| a$ i.e $gcd(a,p) = 1$, every integer on division by p is congruent to one of these $\{1, 2, \ldots p-1\} \pmod{p}$. Now, multiply all the residues by a ie, $\{a, 2a, \ldots (p-1)a\}$.
claim: $\{a, 2a, \ldots (p-1)a\}$ is just the rearragement of $\{1, 2, \ldots p-1\}$
Case 1*:* None of $\{a, 2a, \ldots (p-1)a\}$ is congruent to 0
suppose, $ra \equiv 0 \pmod{p}, 1 < r < p-1$ then, $p|ra$ but it is impossible since, $p \not| a$ and $r < p$.
Case 2*:* These are distinct; no two are congruent to each other
Pick two values: ra and sa where $0 < r \neq s < p$
claim: $ra \equiv sa \pmod{p}$
so, $ra - sa = a(r-s)$ by assumption $p \not| a \implies p \not| (r-s)$ since, $r, s < p$ and $r \neq s$ which means,

$$\prod_{k=1}^{p-1} ka \equiv \prod_{k=1}^{p-1} \pmod{p}$$
$$(p-1)!a^{p-1} \equiv (p-1)! \pmod{p}$$
$$a^{p-1} \equiv 1 \pmod{p}$$

□

Corollary 2. *If p is prime then $a^p \equiv a \pmod{p}$*

Proof. From $a^{p-1} \equiv 1 \pmod{p}$ we multiply by a. □

5 Wilson's Theorem

Theorem 6. *If p is a prime then $(p-1)! \equiv -1 \pmod{p}$*

Proof. Consider,

$$\begin{aligned}
(p-1)! &\equiv 1(2.3. \ldots (p-2))p-1 \pmod{p} \\
&\equiv 1(2.2^{-1}. \ldots (p-2)(p-2)^{-2})p-1 \pmod{p} \\
&\equiv 1.1 \ldots (p-1) \pmod{p} \\
&\equiv p-1 \pmod{p} && (p \equiv 0 \pmod{p}) \\
&\equiv -1 \pmod{p}
\end{aligned}$$

□

Lemma 6. *If $a^2 \equiv 1 \pmod p$ then $a \equiv 1 \pmod p$ or $a \equiv -1 \pmod p$*

Proof. Suppose, $a^2 \equiv 1 \pmod p \implies p|a^2-1 \implies p|(a+1)(a-1) \implies a \equiv 1 \pmod p$ or $a \equiv -1 \pmod p$
(So, the only integer who are their own inverse $\pmod p$ is $\pm 1 \pmod p$) $\square$

6 Chinese Remainder Theorem

Theorem 7. *Given a pairwise coprime positive integers $n_1, n_2, \dots n_k$ and arbitrary integers $n_1, n_2, \dots n_k$ the system of simlutaneous congruences*

$$\begin{aligned} x &\equiv a_1 \pmod{n_1} \\ x &\equiv a_2 \pmod{n_2} \\ &\vdots \\ x &\equiv a_k \pmod{n_k} \end{aligned}$$

has a solution and the solution is unique modulo $N = n_1 n_2 \dots n_k$

Strategy to solve using CRT:

1. Compute $N = n_1 n_2 \dots n_k$
2. For $i = 1, 2, \dots k$ find $N_i = \frac{N}{n_i}$
3. Now solve the congruences $N_i x_i \equiv 1 \pmod{n_i}$
4. We get the all the solution as $x_i \equiv b \pmod{n_i}$ where $b \in \mathbb{Z}^+$
5. Calculate $X = \sum_k^{i=1} x_i a_i N_i \pmod N$ is a solution

7 Euler's Totient

Definition 12. *Euler's Totient function (aslo called phi function) counts the number of positive integers less than n that are coprime to n. That is, $\phi(n)$ is the no. of $m \in \mathbb{Z}^+$ s.t $1 \leq m < n$ and $gcd(m, n) = 1$*

Properties:

- For a prime p, $\phi(p) = p - 1$
- $\phi(p^r) = p^r - p^{r-1}$
- If $gcd(m, n) = 1$ then $\phi(mn) = \phi(m)\phi(n)$
- If $n = p_1^{r_1} \dots p_k^{r_k}$ then $\phi(n) = n\left(1 - \frac{1}{p_1}\right) \dots \left(1 - \frac{1}{p_k}\right)$

Theorem 8 (Euler's Theorem or Euler's Generalization of Fermat's Little Theorem)**.** *For $n \in \mathbb{Z}^+$ and $a \in \mathbb{Z}$, $gcd(a, n) = 1$ we have,*

$$a^{\phi(n)} \equiv 1 \pmod n$$
